DATE: August 3, 2022
TO: Medical Lab Directors, Local Health Departments, and Healthcare Providers
FROM: Robert A. Myers, Ph.D.
Director, Laboratories Administration
RE: Monkeypox Testing Updates

The Maryland Department of Health Laboratories Administration is issuing the following
Monkeypox testing updates.

All specimens sent to the Laboratories Administration for orthopox testing still MUST
have prior approval for testing from the State Epidemiologists or their authorized designee.
Specimens sent without proper approval will not be tested. Please contact the State Epidemiologists
at 410-767-6700 (during normal business hours) or 410-795-7365 (after hours) for consultation.

Febrile Rash Low to Moderate Risk Specimen Collection kits have been distributed to the
Local Health Departments (LHD’s). Please contact your LHD for information regarding specimen
collection kits. Please ensure that the kits being used/distributed are within their expiration date.
Specimens submitted in expired tubes will be rejected. A previous batch of kits that was distributed
has an expiration date of 08/07/22. Unused expired kits are to be returned to the Laboratories
Administration for recycling and reuse of the unexpired kit components. Five additional collection
kits were distributed to each LHD this week.

Specimens collected for testing at the Laboratory Administration must be kept refrigerated
until delivered to the MD Laboratory within 72 hours of collection. Specimens must be kept frozen
(at least -20°C) if they are not received at the MD laboratory within 72 hrs. of collection. This is to
ensure the integrity of the specimens received for testing.

For the safety of all who handle specimens submitted for monkey pox testing, specimens
must be packaged using Category B shipping requirements, even if specimens are sent via routine
or private couriers. See below for basic triple-packaging instructions.

The attached specimen collection guidance can be followed in the event that a health care
provider is unable to obtain an allocated Specimen Collection Kit from their Local Health
Department. The Febrile Rash Form test request form is available on the Laboratories
Administration’s website: https://health.maryland.gov/laboratories/Pages/Home.aspx

Please contact your Local Health Department or the State Epidemiologists with any other
questions or concerns. General questions may be submitted to mdh.monkeypox@maryland.gov.
# Guidelines for Orthopox Rule-Out Specimen Submission

**MDH Infectious Disease Epidemiology**

</tr>
</thead>
</table>
| A minimum of 2* swabs of base of lesion (NO transport media) | Sterile nylon, polyester, or Dacron swab with a plastic, wood, or thin aluminum shaft. Place in a sterile container with NO transport media. **Note: One dry swab may be tested at an LRN Reference laboratory for presumptive results. CDC can provide Monkeypox virus-specific testing on the second dry swab specimen if the first dry swab is presumptive positive at the LRN laboratory.** | **Prior to specimen collection, sanitize area with alcohol and let dry.**  
1. Use a disposable scalpel (or a sterile 26 Gauge needle) to open and remove the top of the vesicle or pustule (do not send the scalpel or needle). Retain lesion roof for testing. (See below)  
2. Swab the base of the lesion with a sterile polyester or Dacron swab.  
3. Place swabs in individual sterile containers. DO NOT ADD ANY VIRAL OR UNIVERSAL TRANSFER MEDIA.  
4. Collect specimens from lesions at different anatomic locations if possible | Refrigerate after collection at 2-8C. Deliver immediately to MDH. |
<p>| <em>Required by CDC</em> | Use 2* swabs per lesion. Place each swab in dry, sterile container and label appropriately. (i.e. body site, description, etc.) | | |
| 1 swab of base of a lesion (in viral transport media) | Sterile nylon, polyester, or Dacron swab with a plastic, shaft. Tube of viral transport media. Use multiple containers when collecting specimens from multiple lesions. | Same as above EXCEPT place swab in viral transport media in order to allow testing for other viral pathogens if the above specimens test negative for orthopox viruses. | |</p>

</table>

**Required Personal Protective Equipment (PPE) to collect specimens**

- Disposable Gown
- Gloves
- Fit tested N95 or PAPR *Surgical mask if not available
- Eye protection- face shield or goggles (note that eye-glasses are not eye protection)

Alcohol based hand sanitizer or sink with soap and water for hand hygiene

**Required Data Elements on Specimens and Requisition Forms**

- All specimens may be listed out on the **FEBRILE RASH (LOW TO MODERATE RISK)** form (Appendix 2). **Use one Tube ID for each body site/specimen type.**
- Each individual specimen must be labeled with the following:
  - Patient name
  - DOB
  - Collection date
  - Specimen site
- Unlabeled specimens will be AUTOMATICALLY REJECTED.
- Under Presumptive Clinical Diagnosis, specify Other: *Monkeypox*
- Test Request Authorized By is your ordering provider. Please only list an MD, DO, PA-C, or CRNP.
- Health Care Provider is the submitting facility name.
- All patient demographic elements are required.
- Consult with MDH Epidemiology to determine risk category.
- Ship packages using Category B Shipping (See below).
- Address package to MDH Labs, "For Monkey Pox testing, ATTN: Amy Armitage or Sali Lukula"
Appendix 1: Packaging and Shipping

Specimens must be shipped using Category B shipping requirements.

Refer to the attached document (Basic Triple Packaging) for packaging and shipping guidelines. If necessary, the MDH Laboratories Administration will arrange for an emergency courier, but will only do so after consultation with the patient’s physician and MDH Physician-On-Call or Epidemiologist.

**BASIC TRIPLE PACKAGING**

Basic triple packaging systems include a primary receptacle such as a tube with adhesive tape around the screw cap or a plate with parafilm around the edges. The primary (1st) receptacle, along with required absorbent and cushioning material, is placed inside a secondary (2nd) container. The 2nd container for diagnostic specimens should be a sealed biohazard or Ziploc bag. The 2nd container is then securely placed within an outer shipping container (tertiary (3rd) container), generally a corrugated cardboard box with cushioning material inside to surround the 2nd container. This outermost container bears the name, address, and telephone number of shipper, name of person responsible with 24/7 telephone number, and the complete name, shipping address, and telephone number of the recipient, plus all the required markings. Include an itemized list of contents in a sealed plastic bag, placed between the 3rd and 2nd containers.

**BASIC TRIPLE PACKAGING:**

- A watertight primary receptacle.
- A watertight secondary receptacle.
- An outer packaging of adequate strength for its capacity, mass and intended use.

Note: For a liquid specimen, absorbent material must be placed between the primary and secondary containers and be capable of absorbing the entire contents of the primary receptacle(s).

Certified packaging systems are designed to withstand specific pressure changes and drop tests. Packaging systems that meet the
packing instruction standards are currently available from vendors specializing in products certified to meet the IATA, USPS, and other carriers' requirements. Packaging systems using fiberboard or aluminum canisters, zip-lock bags, or other uncertified components may not be in compliance.

IT IS THE RESPONSIBILITY OF THE SHIPPER TO COMPLY WITH ALL LAWS AND REGULATIONS REGARDING THE SHIPPING OF INFECTIOUS SUBSTANCES.
