

# 2023

# MARYLAND ANNUAL STI EPIDEMIOLOGICAL PROFILE

Data reported through  
July 26, 2024

Infectious Disease Prevention and  
Health Services Bureau  
Prevention and Health Promotion  
Administration

## Acknowledgements

This report is published by the Maryland Department of Health (MDH). This report would not have been possible without the cooperation, dedication and hard work of health care providers, local health departments, community groups, researchers, and members of the community.

## Maryland Department of Health Non-Discrimination Statement

The Maryland Department of Health (MDH) complies with applicable Federal civil rights laws and does not discriminate on the basis of race, color, national origin, age, disability in its health programs and activities.

## Section I – Technical Notes

### Sexually Transmitted Infections (STI) Reporting

Maryland law requires that a person diagnosed with gonorrhea, chlamydia, or syphilis be reported by name to MDH. As per the reporting requirements specified in the Code of Maryland Regulations ([COMAR](#)) 10.06.01.03, laboratory directors and healthcare providers are required to report all diagnostic STI-related test results. Health care providers also must report treatment administered or prescribed for chlamydia, gonorrhea, and syphilis.

The Code of Maryland Regulations (COMAR) governing laboratory and provider reporting was most recently amended in 2020. The amended regulation now requires laboratories to report laboratory confirmed syphilis and suspected syphilis as indicated by: (a) Any treponemal or non-treponemal results that are qualitative or quantitative, if the results are: (i) Positive; (ii) Reactive; or (iii) Inconclusive; and (b) Any negative or non-reactive results associated with the positive, reactive, or inconclusive results.

### Data Specifications

Surveillance is the ongoing systematic collection, analysis, interpretation, and dissemination of data. Data are collected on all people diagnosed with chlamydia, gonorrhea, or syphilis who were residents of the state of Maryland. Data are presented for people who were Maryland residents at the time of their diagnosis in 2023. Data presented were reported to the MDH through July 26, 2024.

This report presents data with at least a six-month reporting delay. This lag allows for time to report case and laboratory data and to complete investigations.

Please read all table titles and footnotes carefully to ensure a complete understanding of the displayed data. A glossary of terms is also available at the end of this report.

### COVID-19 and STI Surveillance Data

Data for 2020 and 2021 should be interpreted with caution due to the impact of the Coronavirus Disease 2019 (COVID-19) pandemic on access to STI testing and related services. Because STIs often do not show symptoms, and screening is necessary for timely diagnosis and treatment, changes in access to sexual health care, as well as disruptions in public health services, can affect the number of infections diagnosed and reported. Reduced screening during the pandemic may have resulted in undiagnosed infections and those with an STI may have had their infection longer providing more opportunities to transmit infection to their partners. Trends should be interpreted with caution. For more information, please see CDC's [Impact of COVID-19 on STIs](#).

### Recurring Infections

This report describes diagnoses of STIs. Gonorrhea, chlamydia, and syphilis are easily treatable, and it is possible for people to acquire an infection multiple times. This report includes initial and recurring infections.

### Geographic Distribution

Not all address data has been geocoded. Geocoding is the process of assigning geographic identifiers to map features and data records. Addresses are standard data elements and submitted as part of reporting requirements; however, the information may be incomplete which then requires a geocoding process to improve the quality of data.

People experiencing homelessness are reported as living in the city or town where the shelter or care facility reporting the diagnosis is located.

### Residents of Correctional Facilities

STI diagnoses among people reported to be residing in correctional facilities are presented as residing at their last known home address, if available, or in the jurisdiction where the facility of diagnosis is located.

## Race and Ethnicity

The completeness of reporting for race and ethnicity is variable in surveillance data. Definitions of race and ethnicity categories may vary across reporting sources and some reporting sources do not collect or have complete data on race and ethnicity. In this report, Hispanic or Latino people can be of any race.

## Sources of Data

Information on STI diagnoses for 2022 onwards, including residence, age, race and ethnicity, and assigned sex at birth, are from Maryland's installation of the National Electronic Disease Surveillance System (NEDSS) Base System (NBS), as of July 26, 2024.

Data prior to 2022 are from Maryland's installation of the Patient Reporting Investigation Surveillance Manager (PRISM), the Maryland STI surveillance database from 2015-2021. Due to a [Network Security Incident in 2021](#), only data at the state-level is available for 2021.

Data on live births was obtained from Maryland Department of Health's Vital Statistics Administration [2022 Annual Vital Statistics Report](#) and the Centers for Disease Control and Prevention's WONDER Online Database.

Population data by sex, age, and race and ethnicity are from the July 1, 2023 United States Census Estimates. When needed, age groups were divided by assuming uniform age distribution within the age group. Non-Hispanic multiple races and Non-Hispanic another race from the Census were combined into one group.

## Tabulation of Column Totals

Numbers in figures, tables and generally in the text have been rounded. Discrepancies in tables between totals and sums of components are due to rounding.

## Data Suppression

Data are suppressed to protect the confidentiality of people diagnosed with STIs. Data are suppressed when describing a demographic group or geographic area (e.g., jurisdiction) with a population less than 1,000 people. If any cell is suppressed, additional cells are also suppressed as necessary to prevent back calculation of the suppressed cell(s).

## Additional Resources

- [STI Case Definitions](#)

A surveillance case definition is a set of uniform criteria used to define a disease for public health surveillance. Surveillance case definitions enable public health officials to classify and count diagnoses consistently across reporting jurisdictions. Surveillance case definitions may differ from clinical definitions and are not intended to be used by healthcare providers for making a clinical diagnosis or determining how to meet an individual patient's health needs.

## Section II – STI Diagnoses Overview

Surveillance is key to understanding the extent of sexually transmitted infections (STI) in Maryland and in people most affected by STIs. This report provides updated data on chlamydia, gonorrhea, and syphilis, including congenital syphilis, in Maryland.

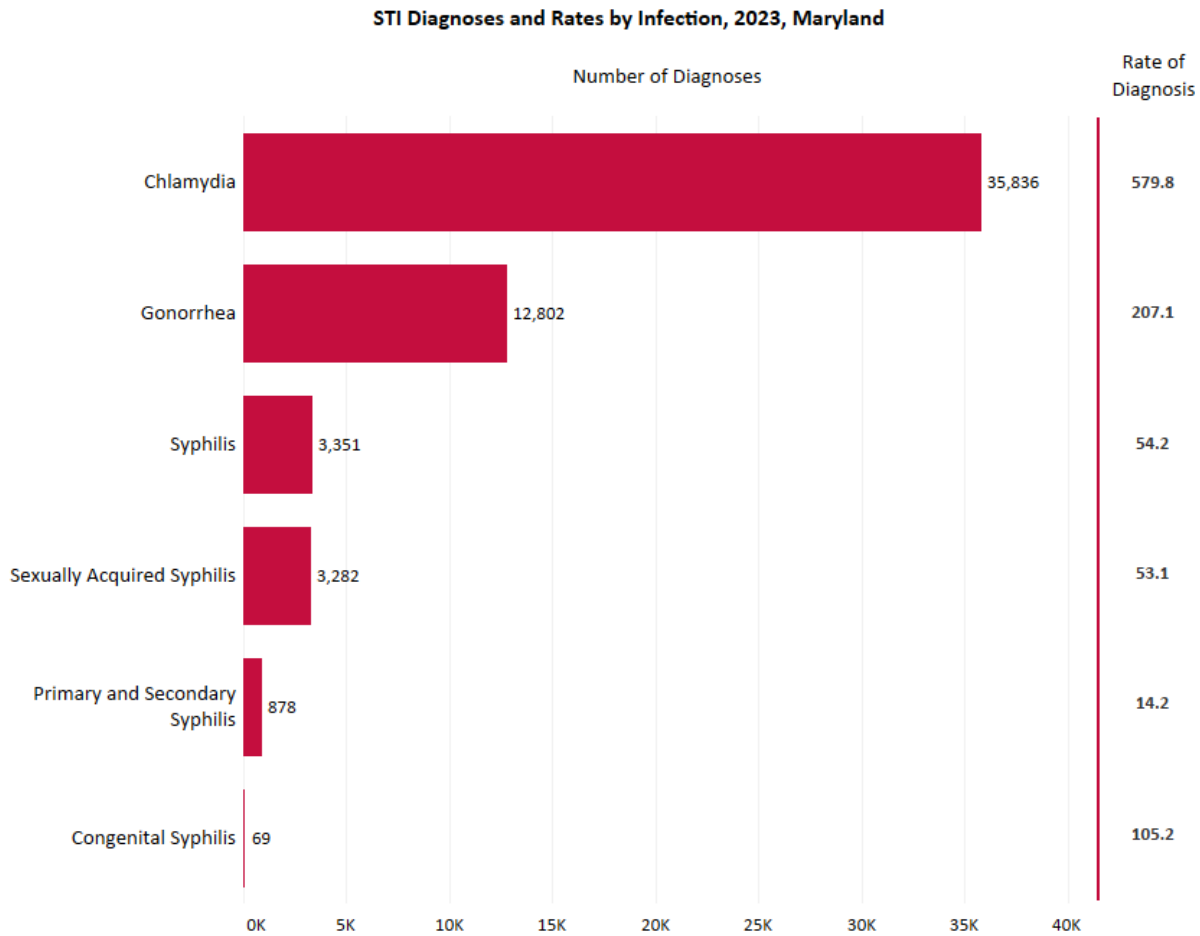

### Maryland STI Diagnosis Rates by Jurisdiction, 2023

- The rate of STI diagnoses in Maryland is **824.9 per 100,000**.  
Jurisdictions with the highest rate of STI diagnoses in Maryland include:
  - Baltimore City: 2,244.0 per 100,000
  - Dorchester County: 1,417.3 per 100,000
  - Wicomico County: 1,191.8 per 100,000
  - Prince George’s County: 1,153.5 per 100,000
  - Baltimore County: 926.8 per 100,000

**Figure 1 – Chlamydia, Gonorrhea, Total Syphilis, Sexually Acquired Syphilis, Primary and Secondary Syphilis, and Congenital Syphilis Diagnoses during 2023, Reported through July 26, 2024**

Infection	2023 Diagnoses				
	Number				
	Total	2022-2023 % Change	2018-2023 Estimated Annual % Change		
			Estimate	Estimate	95% Confidence Interval

Note: \*Live births by jurisdiction are for 2022. Live births by jurisdiction for 2023 have not been released yet.

## Section III – Chlamydia

Chlamydia is a sexually transmitted infection caused by the bacterium *Chlamydia trachomatis*. Although chlamydia is easy to diagnose and treat, it usually produces no symptoms. Therefore, many infections go undetected, and the number of reported diagnoses is likely a significant underestimate of the actual number of people with chlamydia. If individuals with chlamydia are not screened, chlamydia infections go undiagnosed, unreported, and untreated, furthering the spread of infection within the community.

In 2023, a total of 35,836 chlamydia diagnoses were reported among Maryland residents, making it the most common notifiable sexually transmitted infection in Maryland. The rate of diagnosis was 579.8 diagnoses per 100,000 people.

### In 2023, people most affected by chlamydia include:

#### *Geographic Region*

The highest number (8,437), proportion (23.5%), and rate (1,492.6) of chlamydia diagnoses were among **Baltimore City** residents.

#### *Assigned Sex at Birth*

People assigned **female sex at birth** accounted for the highest number (22,296), proportion (62.2%), and rate (702.0) of chlamydia diagnoses.

#### *Race and Ethnicity*

**Non-Hispanic Black people** accounted for the highest number (15,242) and proportion (42.8%) of chlamydia diagnoses. The highest rate of chlamydia diagnoses was among Non-Hispanic **American Indian or Alaska Native people** (901.6).

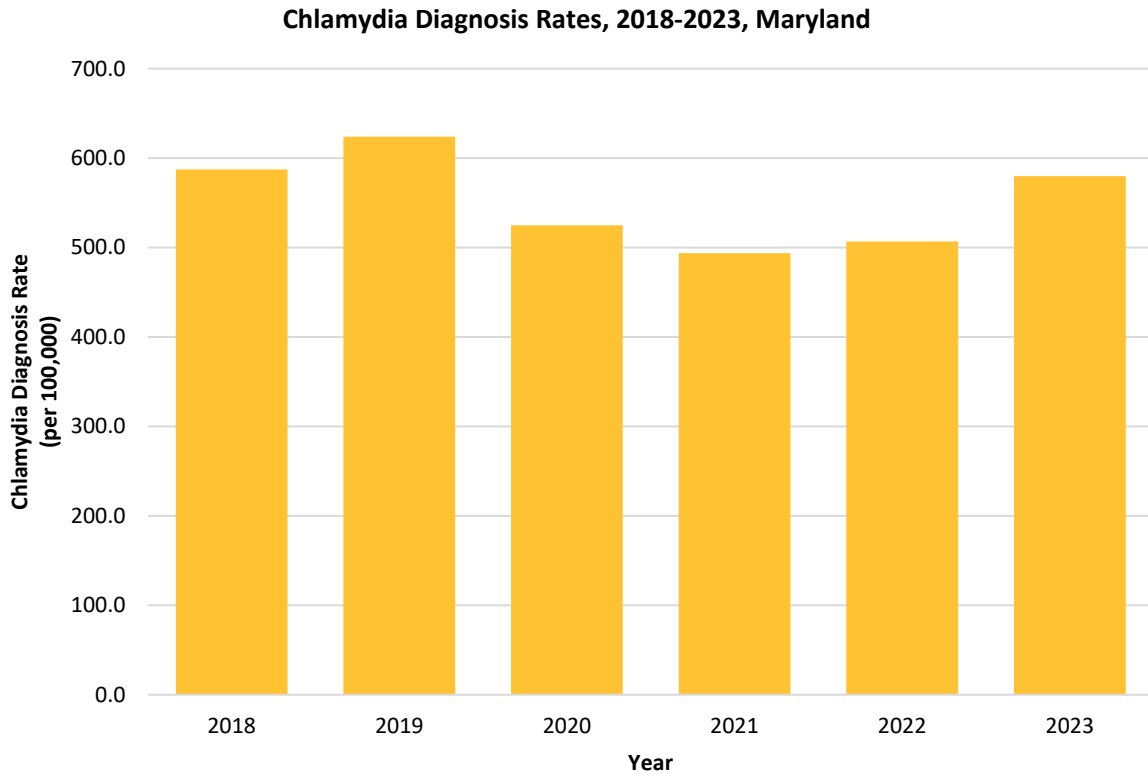

#### *Age*

People **ages 15-24** accounted for the highest number (21,795), proportion (60.9%), and rate (2,847.9) of chlamydia diagnoses.

## Section 3a – Trends in Chlamydia Diagnoses, 2018-2023, Maryland

Figure 2 – Trends in Chlamydia Diagnoses, 2018-2023, Reported through July 26, 2024

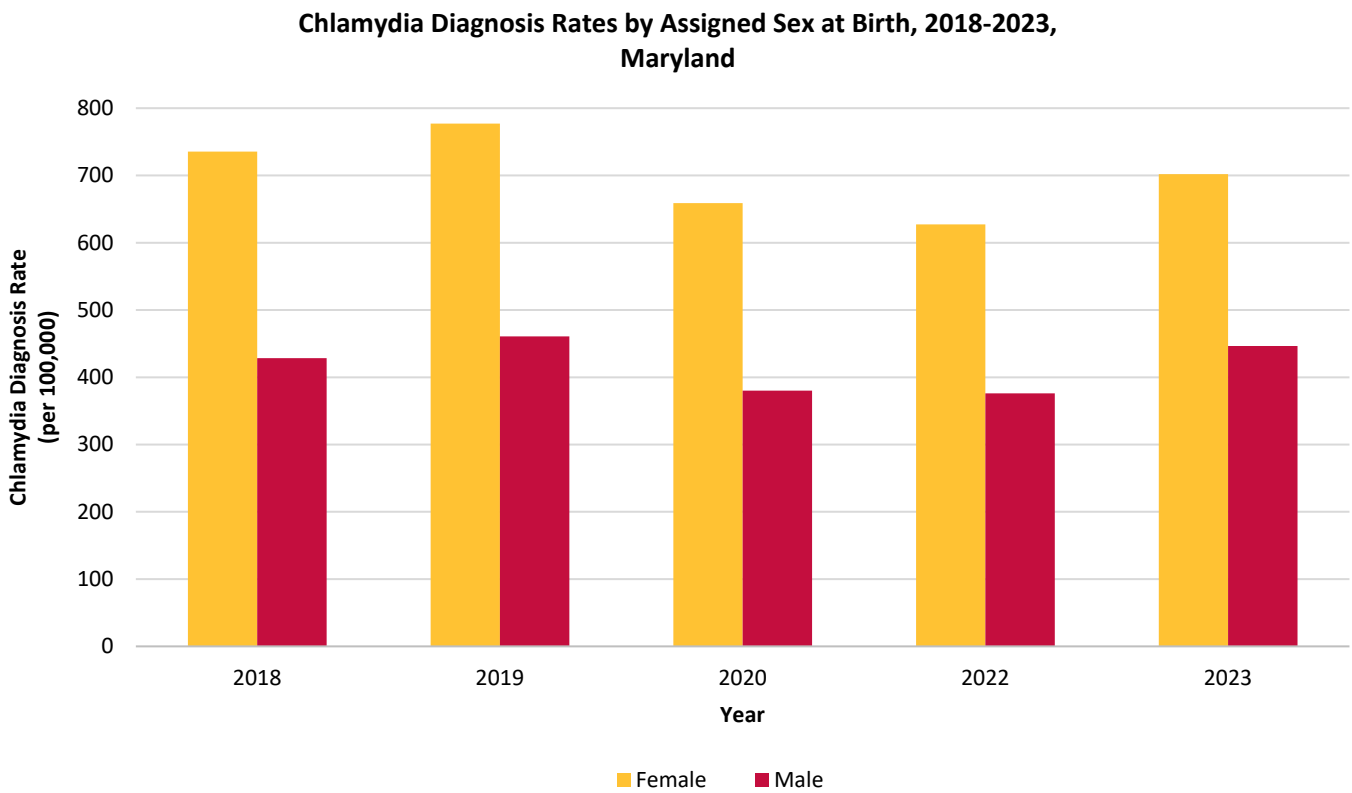

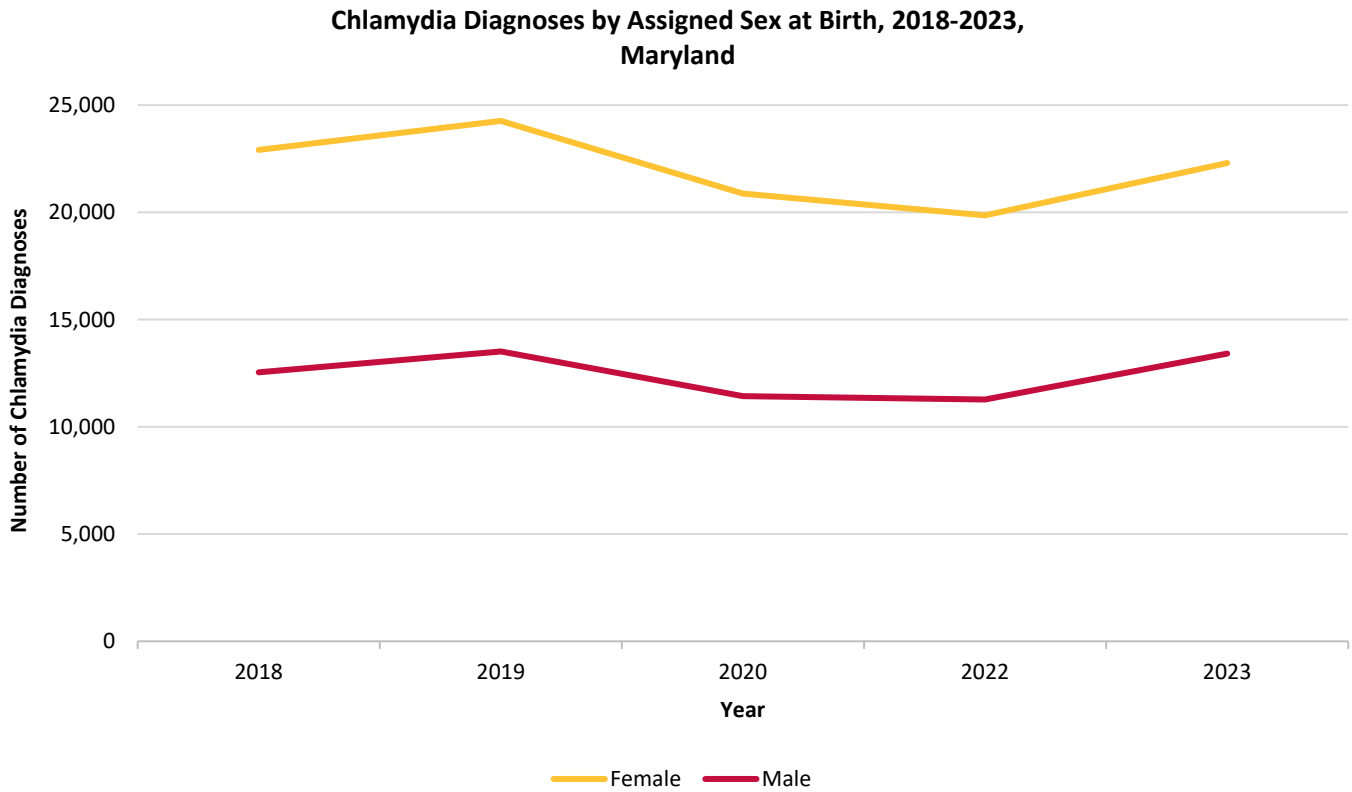

Year of Diagnosis	Population	Chlamydia Diagnoses	
		Number	Rate
2018	6,042,153	35,482	587.2
2019	6,054,954	37,779	623.9

## Section 3b – Chlamydia Diagnoses, 2023, Maryland

### Chlamydia Diagnosis Rates by Jurisdiction, 2023

- The rate of chlamydia diagnoses in Maryland is **579.8 per 100,000**.  
Jurisdictions with the highest rate of chlamydia diagnoses in Maryland include:
  - Baltimore City: 1,492.6 per 100,000
  - Dorchester County: 948.9 per 100,000
  - Wicomico County: 815.8 per 100,000
  - Prince George's County: 805.5 per 100,000
  - Charles County: 620.4 per 100,000

**Table 3 – Chlamydia Diagnoses during 2023 by Jurisdiction of Residence at Diagnosis, Reported through July 26, 2024**

## Section IV – Gonorrhea

Gonorrhea is a sexually transmitted infection caused by the bacterium *Neisseria gonorrhoeae* that may include the symptoms of swelling and pain in internal sexual organs, though the infection sometimes has no symptoms.

In 2023, a total of 12,802 diagnoses of gonorrhea were reported among Maryland residents, making it the second most common notifiable sexually transmitted infection in Maryland. The rate of diagnosis was 207.1 diagnoses per 100,000 people.

### In 2023, people most affected by gonorrhea include:

#### *Geographic Region*

The highest number (4,112), proportion (32.1%), and rate (727.5) of gonorrhea diagnoses were among **Baltimore City** residents.

#### *Assigned Sex at Birth*

People assigned **male sex at birth** accounted for the highest number (7,811), proportion (61.0%), and rate (260.0) of gonorrhea diagnoses.

#### *Race and Ethnicity*

**Non-Hispanic Black people** accounted for the highest number (6,967) and proportion (54.4%) of gonorrhea diagnoses. The highest rate of gonorrhea diagnoses was among **Non-Hispanic multiracial people and people of another race** (528.2).

#### *Age*

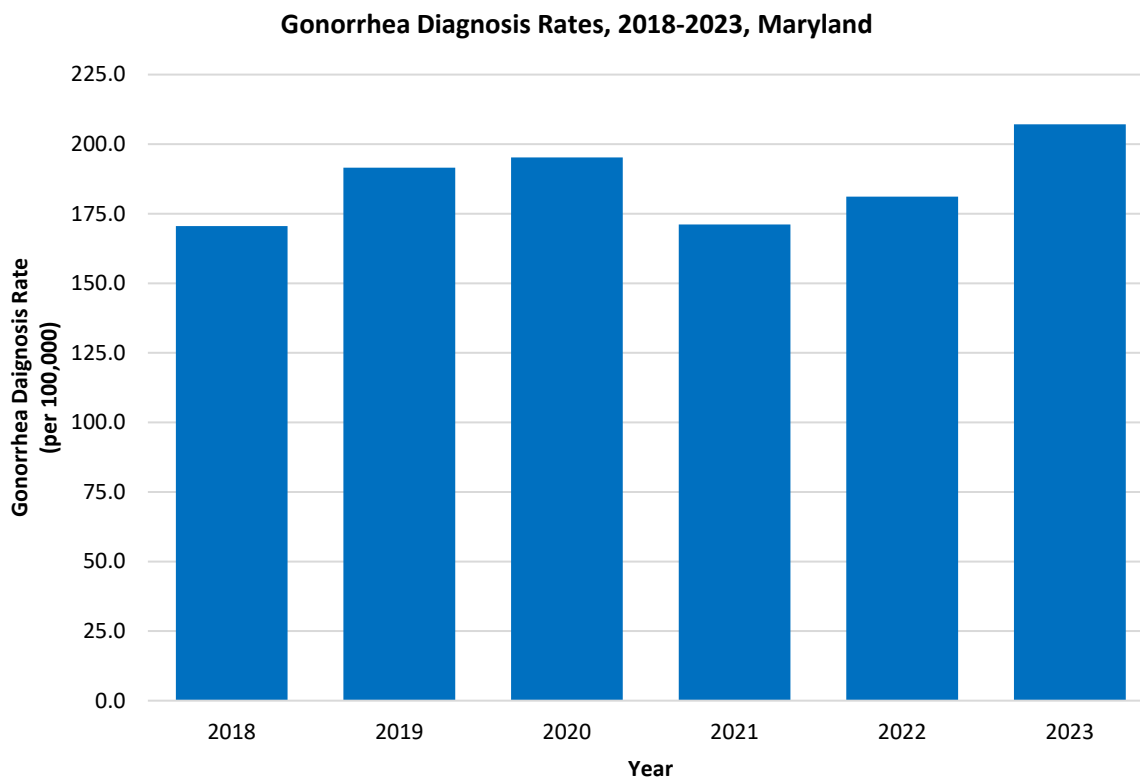

People **ages 15-24** accounted for the highest number (5,858), proportion (45.8%), and rate (765.4) of gonorrhea diagnoses.

## Section V – Syphilis

Syphilis is caused by the bacterium *Treponema pallidum*. Syphilis can remain dormant for years and can cause serious health problems without treatment. Syphilis develops in stages and each stage can have different signs and symptoms. The progression of syphilis can last weeks, months, or years.

In 2023, 3,351 diagnoses of syphilis were reported among Maryland residents. The rate of diagnosis was 54.2 diagnoses per 100,000 people.

**Figure 10 – Syphilis Diagnoses during 2023 by Stage, Reported through July 26, 2024**

Syphilis Infection	2023 Diagnoses		
	Number	% of Total	Rate
<b>Total Syphilis</b>	3,351	100.0%	54.2
<b>Sexually Acquired Syphilis</b>	3,282	97.9%	53.1
<b>Primary and Secondary Syphilis</b>	878	26.2%	14.2
Primary	343	10.2%	5.5
Secondary	535	16.0%	8.7
Early non-Primary, non-Secondary	904	27.0%	14.6
Late or Unknown Duration	1,500	44.8%	24.3
<b>Congenital Syphilis</b>	69	2.1%	105.2

Note. Congenital syphilis rates are per 100,000 live births. All other rates are per 100,00 population.

## Section VI – Sexually Acquired Syphilis

Sexually acquired syphilis includes primary, secondary, and later stages of syphilis, as well as syphilis diagnoses with an unknown duration. Sexually acquired syphilis does *not* include congenital syphilis. In addition to primary and secondary syphilis, later stages are important to track as well, as they contribute to overall burden of syphilis in Maryland. Though not infectious or symptomatic, late syphilis that goes untreated can lead to major health complications later in life. Pregnant people can transmit syphilis to their unborn babies during any stage of infection.

In 2023, 3,282 diagnoses of sexually acquired syphilis were reported among Maryland residents. The rate of diagnosis was 53.1 diagnoses per 100,000 people.

### In 2023, people most affected by sexually acquired syphilis include:

#### *Geographic Region*

The highest number (1,215), proportion (37.0%), and rate (215.0) of sexually acquired syphilis diagnoses were among **Baltimore City** residents.

#### *Assigned Sex at Birth*

People assigned **male sex at birth** accounted for the highest number (2,388), proportion (72.8%), and rate (79.5) of sexually acquired syphilis diagnoses.

#### *Race and Ethnicity*

**Non-Hispanic Black people** accounted for the highest number (1,897) and proportion (57.8%) of sexually acquired syphilis diagnoses. The highest rate of syphilis diagnoses was among **Non-Hispanic multiracial people and people of another race** (133.7).

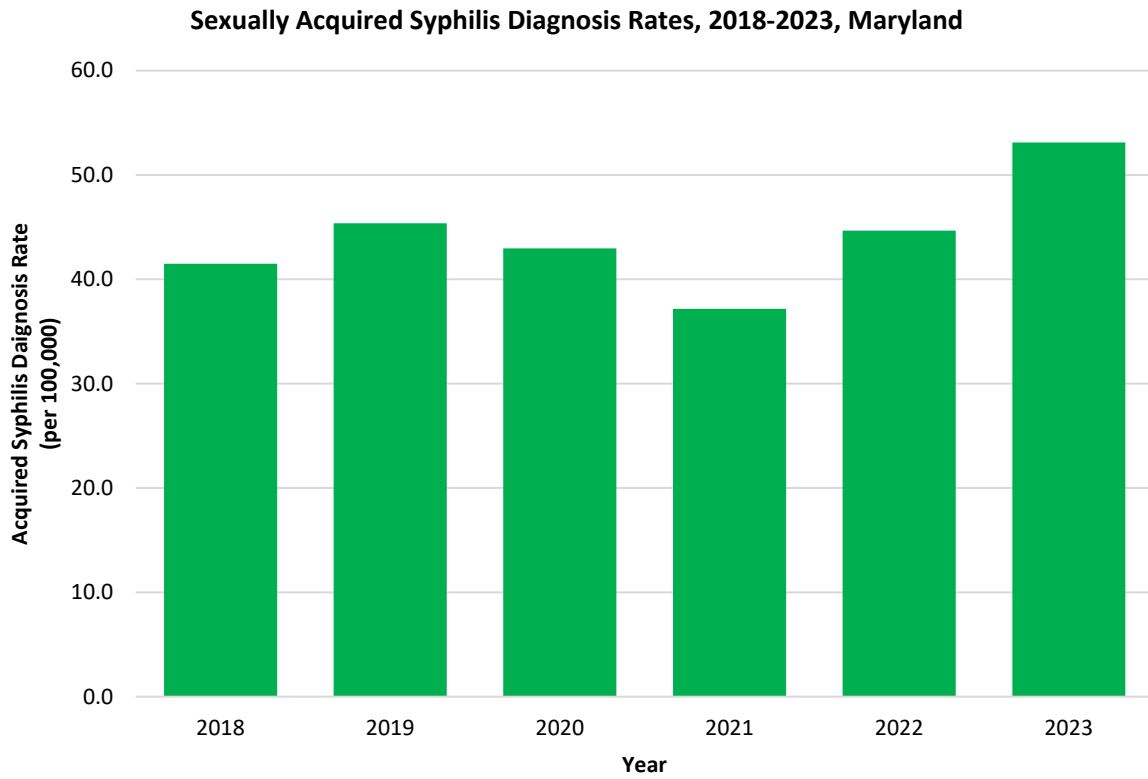

#### *Age*

**25-34**

People **aged 25-34** accounted for the highest number (1,170), proportion (35.6%), and rate (146.2) of sexually acquired syphilis diagnoses.

## Section 6b – Sexually Acquired Syphilis Diagnoses, 2023, Maryland

### Sexually Acquired Syphilis Diagnosis Rates by Jurisdiction, 2023

- The rate of sexually acquired syphilis diagnoses in Maryland is **53.1 per 100,000**.  
Jurisdictions with the highest rate of sexually acquired syphilis diagnoses in Maryland include:
  - Baltimore City: 215.0 per 100,000
  - Prince George's County: 69.9 per 100,000
  - Wicomico County: 66.8 per 100,000
  - Baltimore County: 46.9 per 100,000
  - Washington County: 43.6 per 100,000

## Section VII – Primary and Secondary Syphilis

Primary and secondary syphilis are the infectious stages of syphilis, although pregnant people can transmit the infection to their unborn babies during any stage of infection.

In 2023, 878 diagnoses of primary and secondary syphilis were reported among Maryland residents. The rate of diagnosis was 14.2 diagnoses per 100,000 people.

### In 2023, people most affected by primary and secondary syphilis include:

#### *Geographic Region*

The highest number (283), proportion (32.2%), and rate (50.1) of primary and secondary syphilis diagnoses were among **Baltimore City** residents.

#### *Assigned Sex at Birth*

People assigned **male sex at birth** accounted for the highest number (695), proportion (79.2%), and rate (23.1) of primary and secondary syphilis diagnoses.

#### *Race and Ethnicity*

**Non-Hispanic Black people** accounted for the highest number (510) and proportion (58.1%) of primary and secondary syphilis diagnoses. The highest rate of primary and secondary syphilis diagnoses was among **Non-Hispanic multiracial people and people of another race** (32.8).

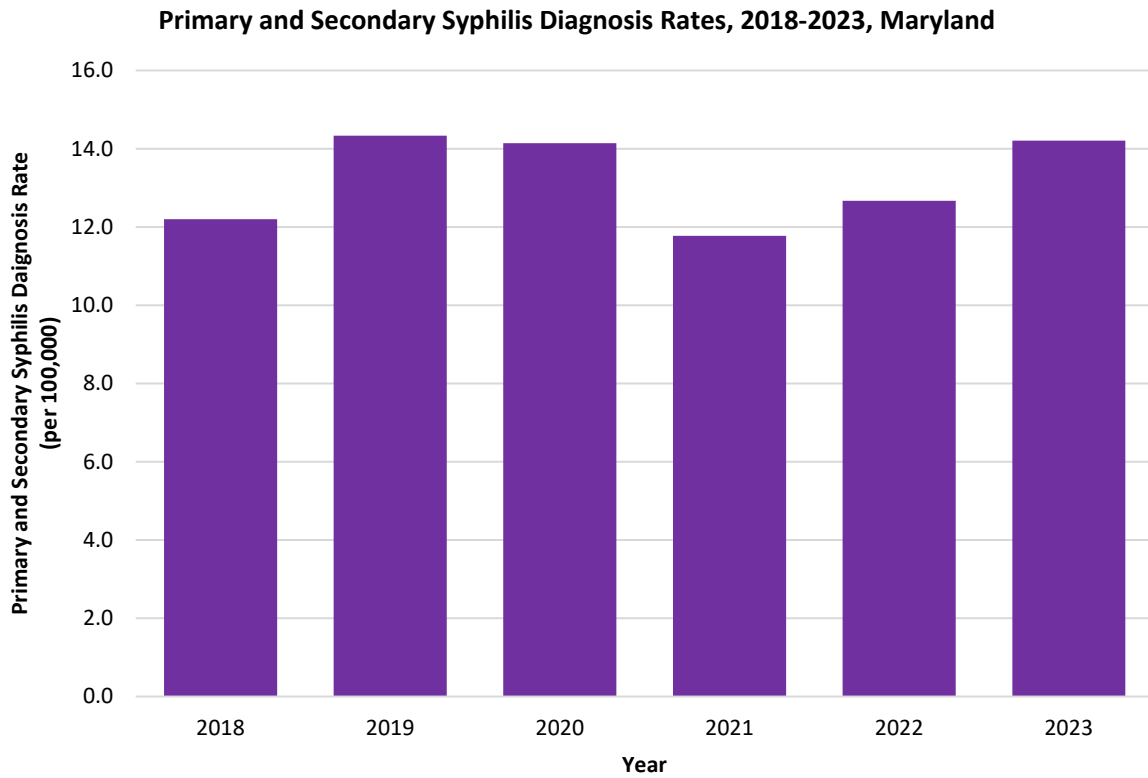

#### *Age*

**30's**

People in their **30s** accounted for the highest number (298) and proportion (33.9%) of primary and secondary syphilis diagnoses. The diagnosis rate among people in their 30s was 35.0 per 100,000.

## Section 7a – Trends in Primary and Secondary Syphilis Diagnoses, 2018-2023, Maryland

## Section 7b – Primary and Secondary Syphilis Diagnoses, 2023, Maryland

### Primary and Secondary Syphilis Diagnosis Rates by Jurisdiction, 2023

- The rate of primary and secondary syphilis diagnoses in Maryland is **14.2 per 100,000**. Jurisdictions with the highest rate of primary and secondary syphilis diagnoses in Maryland include:
  - Baltimore City: 50.1 per 100,000
  - Baltimore County: 19.4 per 100,000
  - Washington County: 16.7 per 100,000
  - Wicomico County: 16.2 per 100,000
  - Prince George's County: 15.5 per 100,000

**Table 18 – Primary and Secondary Syphilis Diagnoses during 2023 by Jurisdiction of Residence at Diagnosis, Reported through July 26, 2024**

## Section VIII – Congenital Syphilis

Congenital syphilis is when syphilis is passed from a birthing person to their infant and can occur at any stage of syphilis. Syphilis infections can be transmitted to unborn babies if a pregnant person is not treated at least 30 days prior to delivery. Congenital syphilis can cause serious health problems for the baby.

In 2023, there were 69 congenital syphilis diagnoses in Maryland. The diagnosis rate was 105.2 per 100,000 live births.

### In 2023, people most affected by congenital syphilis include:

#### *Geographic Region*

The highest number (27), proportion (39.1%), and rate (372.9 per 100,000 live births) of congenital syphilis diagnoses were among **Baltimore City** residents.

#### *Assigned Sex at Birth*

People assigned **male sex at birth** accounted for the highest number (36), proportion (52.2%), and rate (106.6 per 100,000 live births) of congenital syphilis diagnoses.

#### *Race and Ethnicity*

**Non-Hispanic Black people** accounted for the highest number (40), proportion (58.0%), and rate (197.0 per 100,000 live births) of congenital syphilis diagnoses.

## Section 8a – Trends in Congenital Syphilis Diagnoses, 2018-2023, Maryland

Figure 19 – Trends in Congenital Syphilis Diagnoses, 2018-2023, Reported through July 26, 2024

Year of Diagnosis	Live Births	Congenital Syphilis Diagnoses	
		Number	Rate
2018	71,037	29	40.8
2019	70,130	31	44.2
2020	68,546	32	46.7
2021	68,266	24	35.2
2022	68,765	45	65.4
2023	65,594	69	105.2

## Section 8b – Congenital Syphilis Diagnoses, 2023, Maryland

### Congenital Syphilis Diagnosis Rates by Jurisdiction, 2023

- The rate of congenital syphilis diagnoses in Maryland is **100.3 per 100,000 live births**. Jurisdictions with the highest rate of congenital syphilis diagnoses in Maryland include:
  - Baltimore City: 372.9 per 100,000 live births
  - Wicomico County: 142.1 per 100,000 live births
  - Howard County: 125.8 per 100,000 live births
  - Harford County: 113.3 per 100,000 live births
  - Carroll County: 111.5 per 100,000 live births

<b>Total</b>	65,594	69	100.0%	105.2

Note. Diagnoses for Asian people, Native Hawaiian people, and other Pacific Islanders have been combined to align with the aggregation of live birth data. \*The sum of live births will not equal the total. Live births by jurisdiction are for 2022; however, the total number of live births is for 2023, as live births by demographics for 2023 have not been released yet.

## Glossary of Terms

**Age:** Age group at time of STI diagnosis.

**Sexually Acquired Syphilis Diagnoses:** Reported primary, secondary, early non-primary/non-secondary, late, and duration unknown syphilis diagnoses during the specified year.

**Chlamydia Diagnoses:** Reported chlamydia diagnoses during the specified year.

**Congenital Syphilis Diagnoses:** Reported congenital syphilis diagnoses during the specified year.

**Female:** A person whose assigned sex at birth is female.

**Gonorrhea Diagnoses:** Reported gonorrhea diagnoses during the specified year.

**Jurisdiction of Residence at Diagnosis:** Jurisdiction of residence at the time of STI diagnosis.

**Live births:** Babies born alive in the general population.

**Male:** A person whose assigned sex at birth is male.

**People of Childbearing Age:** People of childbearing age (13-49 years old) with childbearing potential.

**Population:** Population estimate for July 1 of the specified year.

**Primary and Secondary Syphilis Diagnoses:** Reported primary and secondary syphilis diagnoses during the specified year.

**Rate:** Number of people living with diagnosed with the specified STI, divided by the population, and multiplied by 100,000.

**STI:** A sexually transmitted infection (STI) is a virus, bacteria, fungus, or parasite people can get through sexual contact.

**STD:** A sexually transmitted disease (STD) develops because of an STI, and the term implies that the infection has led to some symptom of disease.

**Total Syphilis Diagnoses:** Reported primary, secondary, early non-primary/non-secondary, late, duration unknown, and congenital syphilis diagnoses during the specified year.
