FOREWORD

The Injuries in Maryland – 2012 Statistics on Injury-related Emergency Department Visits, Hospitalizations and Deaths report continues the series of reports produced each year in an effort to provide injury professionals with data for program planning and policy development aimed at reducing injuries to Maryland residents.

Injuries remain one of the most important causes of preventable morbidity and mortality in Maryland. As this report shows, the burden and costs of injuries on Maryland is substantial, accounting for more than \$1.1 billion in hospital and emergency department charges in 2012 alone. The Department of Health and Mental Hygiene's commitment to reducing the burden of injuries in Maryland is reflected in many of the priorities identified in the state health improvement process (SHIP).

The Environmental Health Bureau would like to acknowledge the Health Services Cost Review Commission (HSCRC) for providing the hospital discharge and ambulatory care databases, and the Maryland Vital Statistics Administration for the mortality database upon which the analyses were based.

EXECUTIVE SUMMARY

The *Injuries in Maryland – 2012 Statistics on Injury-related Emergency Department Visits, Hospitalizations and Deaths* report provides detailed statistics on all injuries to Maryland residents which required Emergency Department (ED) visits, hospitalization at Maryland hospitals, or caused the death of Maryland residents within the State during 2012. The information presented includes injuries that occurred throughout Maryland and in the 24 political subdivisions.

- In 2012, there were 492,318 injury-related hospital ED visits, 51,587 injury-related hospital discharges and 3,634 injury-related deaths.
- These cases incurred over \$334 million in ED charges and over \$795 million in hospitalization charges.
- These were 8,366 injury-related ED visits per 100,000 Maryland residents during 2012.
- There were 877 injury-related hospital discharges per 100,000 Maryland residents during 2012.
- The injury-related death rate for Maryland residents who died within the State was 61.8 per 100,000 in 2012.
- Men were more likely than women to suffer a fatal injury.
- Overall, the leading causes of injury-related ED visits were: (1) falls, (2) being struck by/against an object or person, and (3) motor vehicle traffic incidents. The leading causes of injury-related hospitalization were: (1) falls, (2) poisoning, and (3) motor vehicle traffic incidents. The leading causes of injury-related death were: (1) poisoning, (2) falls, and (3) firearms.
- The burden of injury to Maryland amounted to 89,845 years of potential life lost (YPLL) during 2012. Forty five percent of this total was due to unintentional injuries, 18.6% due to homicides, and 14.8% due to suicides.

INTRODUCTION

Injury, both intentional (violence) and unintentional (accidents), is a leading cause of death and disability in Maryland. This public health problem affects Marylanders on a variety of levels according to severity, shown by the diagram below.

The objective of this report is to characterize the burden of the top three categories in the Injury Pyramid on Marylanders in 2012. The information presented here can best be used to inform injury prevention programs and policies on the state and local levels.

DATA ISSUES AND METHODOLOGY

Hospital Discharge and Emergency Department Contact Data

Data Source

According to Maryland State law, the 47 non-federal acute care general hospitals are required to submit uniform abstract (UB-04) data on all hospital ED visits and hospital discharges to the Maryland Health Services Cost Review Commission (HSCRC). Data regarding injury-related emergency visits and hospitalizations were derived from the HSCRC Ambulatory Care and Hospital Discharge Databases, respectively. These data comprise demographic, clinical, diagnostic and procedure information which are used by the HSCRC to set hospital rates under Maryland's charge-per-case payment system.

Methodology

Information on injury-related ED visits and hospitalizations is based on the external cause of injury codes (E-codes) from the ninth revision of the International Classification of Diseases, Clinical Modification (ICD-9-CM). The E-codes describe the mechanism or cause of injury as well as the manner or intent of the injury, and are classified according to recommendations set forth by the Centers for Disease Control and Prevention (CDC). See Appendix A for detailed descriptions of each category.

The cases included in this report were identified by searching records for the first-listed E-code, starting with the designated E-code field, and proceeding through the diagnosis fields in numeric order (i.e., primary diagnosis, first secondary diagnosis, etc.). Each record is counted only once. If multiple injuries are present, only the first-listed E-code is counted. The methodology used to identify Maryland residents and ED visits in the HSCRC data files changed in 2014. Therefore, data reports released in 2014 and beyond may not be comparable to data reports released in earlier years.

Injuries caused by misadventures during surgical and medical care or abnormal reactions to drugs, medicinal or biological substances were excluded from this report.

Caveats

The HSCRC data presented in this report refer to encounters with the healthcare system- not to individuals or to individual injury incidents. Recurring visits, either for the same injury, or for subsequent injuries, are counted separately.

Note that these data do not include contact with institutions outside of Maryland, which underestimates the total burden of injury-related hospitalizations and emergency department contacts by Maryland residents. The absence of these data is likely to have the greatest impact on counts and rates for jurisdictions that border other states or the District of Columbia.

Fatal Injury Data

Data Source

Data on fatal injuries were derived from the death certificates collected by the Maryland Vital Statistics Administration.

Methodology

Since 1999, the tenth revision of the International Classification of Diseases has been used to code the causes of death reported on death certificates. ICD-10 includes expanded detail for many conditions.

The injury-related deaths reported in this publication refer to individuals whose cause of death codes include at least one external cause of injury code (codes beginning with V, W, X, or Y, see Appendix B). Codes indicating adverse effects of medical care were excluded.

BURDEN OF INJURY IN MARYLAND

In 2012, injury-related hospital and emergency department encounters incurred over \$267 million in ED charges and over \$795 million in hospitalization charges. Marylanders spent over 235,000 days in the hospital as a result of injuries.

Table 1 illustrates the burden levied by injuries to Marylanders as represented by ED charges, hospitalization charges, and hospital length of stay by cause of injury.

There is considerable variation in cost by type of injury. Firearm-related injuries had the highest average charge per ED visit (\$1,654), but represented only 0.12% of all injuries. Conversely, although fall-related injuries were not the most costly per event (average charge of \$642), they accounted for the greatest portion (27.1%) of injury-related ED charges for the state, amounting to over \$85 million in 2012 (Table 1).

Likewise, firearms were one of the causes with the most costly injury hospitalizations (average \$36,681), and fall-related injury comprised the greatest proportion of hospital charges, summing to over \$328 million in 2012 (Table 1).

Years of potential life lost (YPLL) are calculated for individuals before age 75 to quantify the impact of diseases and conditions on life lost in childhood, adolescence, and early to middle adulthood. As Table 2 shows, a total of 89,845 years of potential life lost were attributable to injuries during 2012, of which 45.1% was due to unintentional injuries, 18.6% due to homicides, and 14.8% due to suicides.

Together, poisonings, firearms, and motor vehicle-related deaths accounted for 70% of the total YPLL. Although fall-related injuries were the second leading cause of injury-related deaths, they were only the sixth leading contributor to YPLL and far behind the leading causes. Since fall-related injuries are typically more life threatening to elderly persons, falls had the (second) lowest average YPLL per fall death (18.3 years).

INJURY RATES BY AGE

Another way to describe the burden of injury on different age groups in Maryland is through rates. Please see below an example of how a rate is calculated:

Sample Rate Calculation

In the year of 2012, Maryland children ages 5-14 experienced:

64,597 injury-related emergency department visits.

In that same year, the Maryland Vital Statistics Administration estimates the average population of Maryland children in that age group to be:
746,144.

To find the rate of unintentional injury-related emergency department visits among Maryland children in 2012, we perform the following calculation:

$$\frac{64,597 \text{ emergency department visits}}{746,144 \text{ children}} = 0.0866 \text{ injury-related ED visits for each Maryland child in the 5-14 age group in 2012}$$

This small number can be confusing to communicate, so instead we express this rate in terms of “100,000 people”.

$$\frac{0.0866 \text{ injury-related ED visits}}{1 \text{ Maryland child age 5-14}} \times \frac{100,000 \text{ Maryland children age 5-14}}{100,000 \text{ Maryland children age 5-14}} = 8,657 \text{ injury-related ED visits per 100,000 Maryland children ages 5-14}$$

$$\text{We know: } \frac{100,000 \text{ Maryland children age 5-14}}{100,000 \text{ Maryland children age 5-14}} = 1$$

Therefore, we effectively multiplied a very small number by 1 in a clever way to make the number easier to understand. The value of the rate has not changed; only the way we express it.

In a quick and easy way, we can say that in the year 2012, the rate of injury-related emergency department visits among Maryland children ages 5-14 was 8,657 per 100,000.

The series of charts presented below (1-7) shows how injury rates vary across age groups.

INJURY BY SEX (MALE/FEMALE)

Men suffered more injuries than women overall, and most types of injury were more common in men than in women. Charts 8-13 below compare the rates of ED visits, hospital discharges, and death for men and women by cause of injury, as well as intent of injury.

INJURY BY RACE

Rates of injury also varied among racial groups. Rates of injury-related ED visits were higher for African-American than whites for most mechanisms of injury. Aside from fall-related hospitalizations, where whites experienced higher rates than African Americans, and firearm-related hospitalizations, where African Americans experienced higher rates whites, the rates of other injury-related hospitalization were similar between these two groups. Low event frequencies limit our analysis of rates among other racial groups, but rates are reported when based on counts of 20 or more incidents.

Charts 14-16 below illustrate the differences in injury rates by race, type of injury, and outcome. Due to sizable differences among various injury mechanisms, the ED and hospital discharge figures have been subdivided to enhance readability.

Manner of injury by race

For all races, the majority of injuries seen in the ED were unintentional and assault-related injuries. However, the rates in African American residents for these type injuries were greater than they were for other residents. (See Table 7.)

White residents had the highest rates of injury-related hospitalization overall and for self-inflicted and unintentional injuries when compared to other residents. African American residents had the highest rates of hospitalization for injuries due to assault and injuries of undetermined manner. (See Table 8.)

Although the overall injury-related death rate was similar between the white and African American populations, the distribution of intent was very different. The suicide rate was higher among white residents, while the homicide rate was higher among African American residents. (See Table 9.)

INJURY OVER TIME

When observing trends in injuries, there are two primary sources of measurement. First, it is possible to track the number of events; with this method, it is possible to make social math statements, such as the following: “Over 12 fall-related deaths occurred every week in 2012.” Tables 10 and 12 below contain this information, across years 2007-2012.

Another way to characterize the burden of injury is by considering rates. As explained on page 17, rates express how many incidents occurred compared to the total population at hand. In tables 11 and 13 below, rates are reported for years 2007-2012. Please note that these rates are age-adjusted to ensure a more accurate comparison of one year’s data to another.

MARYLAND AND LOCAL JURISDICTIONS

ED Visits

Although the highest numbers of injuries requiring an ED visit occurred in Baltimore City, Baltimore County, Prince George's, Montgomery, and Anne Arundel Counties, the areas with the highest rate per 100,000 of injury-related ED visits were Dorchester County, followed by Kent, Allegany, Saint Mary's and Garrett counties. (Table 14). The lowest rates occurred in Montgomery and Howard Counties.

Deaths

As was the case with injury-related ED visits and hospitalizations, the jurisdictions with the highest frequencies of injury-related death and those with the highest rates are not necessarily the same (See Table 18). While Baltimore City, Baltimore County, and Prince George's County had the highest actual numbers of injury-related deaths, the jurisdictions with the highest rates of injury-related deaths were Caroline County, Baltimore City, and Allegany County.
