

MARYLAND VITAL STATISTICS ANNUAL REPORT

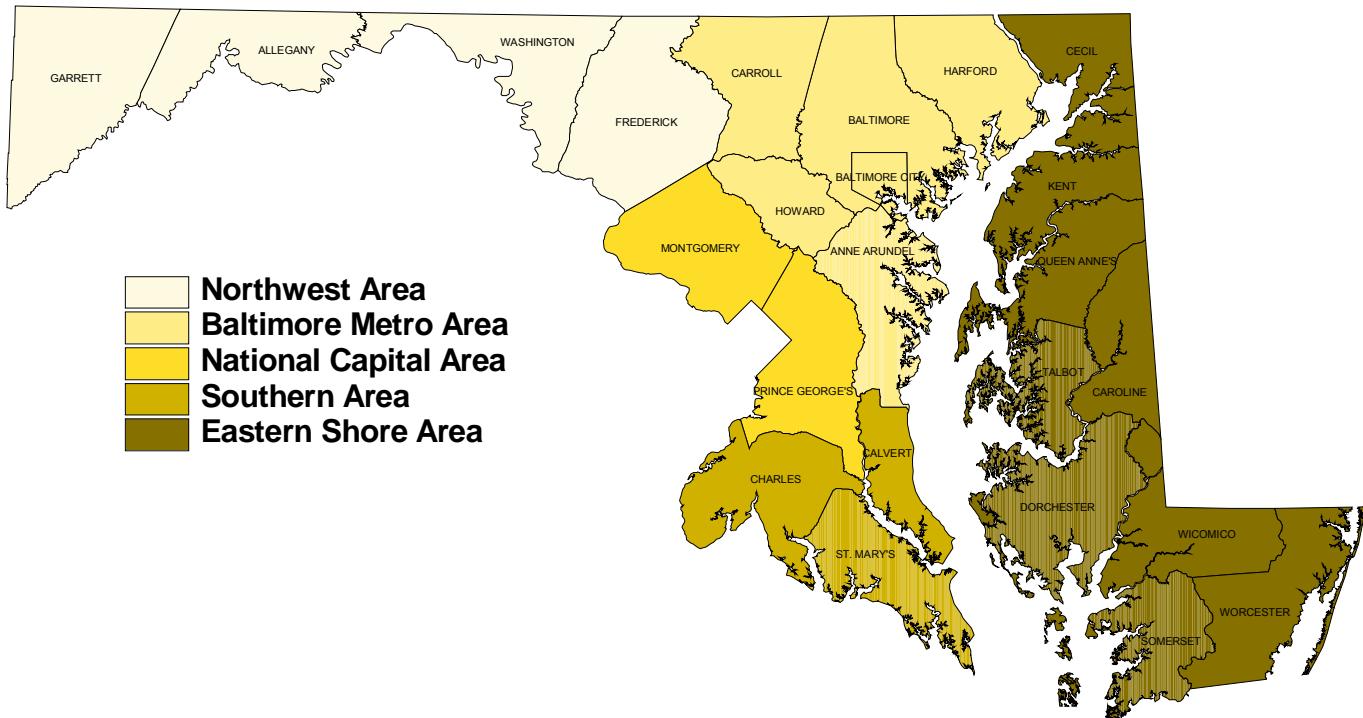

2004

**Robert L. Ehrlich, Jr., Governor
Michael S. Steele, Lt. Governor**

**S. Anthony McCann, Secretary
Dept. of Health and Mental Hygiene**

MARYLAND

Regions and Political Subdivisions

The services and facilities of the Maryland State Department of Health and Mental Hygiene (DHMH) are operated on a non-discriminatory basis. This policy prohibits discrimination on the basis of race, color, sex, or national origin and applies to the provisions of employment and granting of advantages, privileges and accommodations.

The Department, in compliance with the Americans With Disabilities Act, ensures that qualified individuals with disabilities are given an opportunity to participate in and benefit from DHMH services, programs, benefits and employment opportunities.

67B.	Absolute Divorces and Annulments by Age of Wife at Time of Decree, Maryland, 2004	201
68.	Absolute Divorces and Annulments by Number of Children Reported Under 18 Years of Age and Duration of Marriage, Maryland, 2004.....	202
69.	Absolute Divorces and Annulments by Number of Marriages of Husband and Number of Marriages of Wife, Maryland, 2004.....	203

Comparative Vital Statistics

70.	Selected Natality Data by Race for Maryland and the United States, 1995-2004.....	207
71.	Selected Mortality Data by Race for Maryland and the United States, 1995-2004	209

DEFINITIONS AND EXPLANATORY NOTES

Data contained in this report are presented on a county of residence basis, regardless of where the vital event occurred, unless specifically noted otherwise. Birth, death and fetal death data include information for all Maryland residents, regardless of whether the birth or death occurred in Maryland or in the remainder of the United States. Information on marriages and divorces is limited to events occurring in Maryland.

DEFINITIONS

Age-adjustment: A methodology used to compare rates among populations with differing age distributions. The direct method of age-adjustment was used to calculate the rates in this report. Using this methodology, the crude death rate for each age group is multiplied by the proportion of the standard population within that age group; the sum of the products is the age-adjusted rate. Age-adjusted rates in this report are standardized to the projected 2000 U.S. population and are expressed as rates per 100,000 population. Publications prior to 1999 present adjustments to the 1940 standard U.S. population. **Age-adjusted rates should not be compared to crude rates or to adjusted rates calculated using a different standard population.** See page xiii for a discussion of the new standard.

Age-specific birth rate: Number of births to mothers of a specific age per 1,000 females in that age group.

Age-specific death rate: Number of deaths in a specific age group per 1,000 or 100,000 population in the same age group.

Crude birth rate: Number of live births per 1,000 females.

Crude death rate: Number of deaths from all causes per 1,000 or per 100,000 population. Death rates for specific causes are per 100,000 population.

General fertility rate: Total number of births per 1,000 females aged 15-44.

Fetal death*: Death before the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

Fetal mortality rate*: Number of reportable* fetal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty or more weeks' gestation.

Infant death: Death occurring to a person under one year of age.

Infant mortality rate: Number of infant deaths per 1,000 live births.

Length of pregnancy: A measure of the duration of gestation in completed weeks as estimated by the attending physician.

Live birth*: The complete expulsion or extraction from its mother of a product of human conception, irrespective of the period of gestation, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscle, whether or not the umbilical cord has been cut or the placenta is attached.

Life expectancy: The average number of years of life remaining for an individual of a particular age group.

Low birth weight: A live birth weighing less than 2,500 grams (5.5 pounds).

Maternal death: Deaths due to pregnancy, childbirth and the puerperium (ICD-10 codes O00-O95, O98-O99, A34) occurring either during pregnancy or within 42 days of delivery or termination of pregnancy.

Maternal mortality rate: Number of maternal deaths per 100,000 live births.

Neonatal death: Death occurring to an infant under 28 days of age.

Neonatal mortality rate: Number of neonatal deaths per 1,000 live births.

Perinatal death: In this report, defined as the death of a fetus of 28 or more weeks' gestation or of an infant less than 7 days of age. Other commonly used definitions for perinatal death range from 20 to 28 weeks' gestation through seven to 28 days of life.

Perinatal death rate: In this report, defined as the number of perinatal deaths divided by the number of fetal deaths of 28 or more weeks' gestation plus the number of live births times 1,000. See perinatal death.

Postneonatal death: Death occurring to an infant between 28 days and one year of age.

Postneonatal mortality rate: Number of postneonatal deaths per 1,000 live births.

EXPLANATORY NOTES

Population

Between the decennial censuses, the Census Bureau, with the assistance of the Federal State Cooperative Program for Population Estimates (FSCPE), develops annual population estimates. These estimates use as their starting point data from the most recent decennial census (currently April 1, 2000). Estimates for each year are derived using data on resident births, resident deaths, net international immigration, internal migration and net movement of U.S. armed forces. Estimates by race, sex, age and Hispanic origin are prepared for all states and counties. Estimates are also available for certain subcounty areas. Further information on the preparation of population estimates may be found on the Census Bureau web site at <http://www.census.gov/popest/topics/methodology>.

The population estimates appearing in this report for Maryland and its political subdivisions are "bridged-race" estimates prepared by the National Center for Health Statistics (NCHS) in collaboration with the U.S. Census Bureau. These data were prepared in order to "bridge" population data for multiple race individuals back to single race categories, and to make racial categories consistent with pre-Census 2000 data. In 1997, the Office of Management and Budget (OMB) issued a new directive with regard to the collection of race data, and beginning with the 2000 U.S. Census, respondents were given the opportunity to identify themselves by more than one race. At the same time, the number of race categories increased from four (White; Black or African American; American Indian or Alaskan Native; and Asian or Pacific Islander) to five (American Indian or Alaskan Native; Asian; Black or African American; Native Hawaiian or Other Pacific Islander; and White). These changes increased the number of potential race categories from four to 31.

Since birth and death records in most states collect race information using pre-1997 OMB standards, the numerator (number of births or deaths) and denominator (population) data used to calculate vital statistics rates are not compatible. To address this issue, NCHS and the U.S. Census Bureau developed a method of "bridging" the 31 racial categories to the four single race categories used prior to Census 2000. This methodology was developed using information obtained from the National Health Interview Survey, in which respondents who chose more than one race were asked to also choose the single race with which they most closely identified. Further information pertaining to the preparation of bridged population data may be found on the NCHS web site at <http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>.

The 2004 population estimates appearing in this report are based on figures released by the U.S. Census Bureau on April 14, 2005. Baltimore City successfully challenged the accuracy of the Baltimore City population, and as a result, the Census Bureau announced in October 2005 that the population of Baltimore City, and therefore

the State, would be increased by 5,692. Since the Census Bureau has not yet revised the age, race and sex breakdowns of the Baltimore City and Maryland populations, the estimates appearing in this report are based on the original estimates prepared by the Census Bureau. The Census Bureau will release revised 2004 figures for Baltimore City and Maryland when 2005 population estimates are released in April 2006. Revised estimates by age, race, and sex will be released in the fall of 2006.

Cause of Death

Beginning with 1999 data, the tenth revision of the International Classification of Diseases (ICD) was used to code the causes of death reported on death certificates. The ICD is a classification system for mortality data developed by the World Health Organization and other international centers to promote comparability in the collection, classification, processing and presentation of mortality statistics. The ICD-10 is periodically revised to reflect advances in medical science. ICD-10 replaced ICD-9, which was used with 1979-98 data.

ICD-10 differs substantially from ICD-9. ICD-10 includes expanded detail for many conditions, transfers conditions between classifications, incorporates the use of alphanumeric instead of numeric codes, modifies coding rules and modifies tabulation lists. Because of these changes, the presentation of mortality data by cause of death is substantially different, and discontinuities in trend data between ICD revisions are likely to exist for certain causes of death. To assist in bridging discontinuities in trends of causes of death between ICD revisions, the NCHS has prepared comparability ratios for 113 selected causes of death (see next section). Comparability ratios were prepared by double coding a national sample of 1996 deaths using both ICD-9 and ICD-10 coding. Preliminary comparability ratios for 113 Selected Causes of Death are shown on page xiv of this report. These ratios were calculated by dividing the number of deaths attributed to a certain cause of death using ICD-10 coding by the number of deaths using ICD-9 coding. A ratio of 1.00 indicates that the same number of deaths was assigned to a particular cause of death using ICD-9 and ICD-10 coding. A ratio of less than 1.00 results from either a decline in the assignment of deaths to a cause in ICD-10 compared with ICD-9, or because a cause of death in ICD-10 is only a part of the ICD-9 revision title. For example, the comparability ratio for salmonella infections is 0.81, which indicates that 19% fewer deaths occur as a result of the introduction of the ICD-10 revision. This ratio is calculated by dividing the number of deaths in ICD-10 codes A01-A02 by the number of deaths in ICD-9 codes 002-003. A ratio of greater than 1.00 may result from an increase in deaths assigned to a particular cause in ICD-10, or because the ICD-10 revision title is broader than the ICD-9 title for a cause of death. An example would be septicemia, with a comparability ratio of 1.19. This ratio indicates that 19% more deaths occurred from this cause using ICD-10 coding than by using ICD-9 coding.

In order to compare trends, all age-adjusted rates for causes of death shown in this report for years earlier than 1999 have been adjusted to the tenth revision by multiplying the rate as it existed using the ninth revision by the comparability ratios described above

and presented on page xiv.

Additional information on ICD-10 may be obtained on the NCHS web site at <http://www.cdc.gov/nchs/about/major/dvs/icd10des.htm>.

Age-adjusted Death Rates

Beginning with data year 1999, all federal agencies adopted the year 2000 projected U.S. population as the new standard for age-adjusting death rates. The year 2000 population replaces at least three different population standards used in earlier years. The use of these multiple standards resulted in difficulties comparing data prepared by agencies using different standards, and caused confusion among data users. Use of the 2000 standard was recommended to promote uniformity of data among agencies and to eliminate the need to calculate mortality rates using more than one standard.

As described in page ix of this report, age-adjustment is the process used to compare rates among populations with differing age distributions. Age-adjustment is used to eliminate the confounding effect of differences in age distributions among groups or over time.

Age-adjusted rates prepared using the year 2000 standard cannot be compared with rates calculated using other standards. Therefore, all age-adjusted rates for earlier years presented in the Maryland Vital Statistics Annual Report have been recalculated using the year 2000 standard population.

Further information about the year 2000 population standard may be downloaded from the NCHS website by clicking on “Year 2000 Population Standard for Age-Adjusting Death Rates in the United States Brochure” at <http://www.cdc.gov/nchs/about/major/dvs/mortdata.htm>.

*The definitions of live birth and fetal death are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition – Supplement. Fetal deaths are reportable for filing purposes only if the death occurs after a period of gestation of twenty or more completed weeks (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report are only those of twenty or more weeks gestation.

Table III. Comparable category codes and estimated comparability ratios for 113 selected causes of death, injury by firearms, drug-induced deaths, and alcohol-induced deaths according to the Ninth and Tenth Revisions, International Classification of Diseases

Cause of death (Based on the Tenth Revision, <i>International Classification of Diseases, 1992</i>)	Category codes according to the Tenth Revision (ICD-10)	Category codes according to the Ninth Revision (ICD-9)	Number of deaths allocated according to		Estimated comparability ratio	Standard error	Relative standard error	95-percent confidence limits

VITAL STATISTICS HIGHLIGHTS

Highlights of 2004

Population

- The reported **population** of Maryland in 2004 was 5,558,058. However, a late revision by the U.S. Census Bureau to the Baltimore City population increased the state estimate to 5,563,750.
- The distribution of the 2004 Maryland population was as follows: White (65.1%), Black or African-American (29.6%), Asian or Pacific Islander (4.9%) and American Indian (< 1%).
- Over 5% of the population was made up of individuals of Hispanic origin.

Life expectancy

- The **life expectancy** for an infant born in 2004 was 77.7 years. For whites, this figure was 79.0 years and for blacks, 73.6 years.

Births

- There were 74,500 **live births** to Maryland residents in 2004, compared with 74,865 births in 2003. The overall **birth rate** was 13.4 births per 1,000 population.
- The **birth rate** among women of Hispanic origin was 25.6, nearly double the statewide average.
- Births to **teen mothers** under the age of 20 accounted for 8.5% of all births. Three percent of all births were to mothers under the age of 18.
- The **adolescent birth rate** fell to 32.3 per 1,000 women ages 15-19 years in 2004, a 3.0% decline from the 2003 rate of 33.3.

Adolescent birth rates have been falling steadily over the past decade, particularly among blacks.

- Nearly fourteen percent of births were to women who had completed fewer than 12 **years of education**.
- **Fourth and higher order births** accounted for 10.2% of all births in 2004, nearly identical to the 2003 figure of 10.3%.
- In terms of **area of occurrence**, 90% of all births to Maryland residents occurred within the State. Nearly 8% occurred in the District of Columbia and 2% in other states.
- Over 35% of all births in 2004 were to **unmarried women**. For white women this figure was 25.3%, for black women, 59.6%, and for Hispanic women, 48.9%.
- Over 82% of live births were to women who began **prenatal care** during the first trimester of pregnancy, and 3.9% were to women who received late (third trimester) or no prenatal care.
- The incidence of **low birth weight** (birth weight <2500 grams) was 9.4% in 2004. This figure was 7.4% for white infants, 13.2% for black infants and 7.3% for Hispanic infants. The incidence of **very low birth weight** (birth weight <1500 grams) was 2.1% overall, 1.4% for whites, 3.6% for blacks and 1.5% for Hispanics.
- Over eleven percent of infants with known **gestational age** were delivered earlier than 37 weeks gestation. This figure was 9.9% for whites, 14.3% for blacks and

- 9.4% for Hispanics.
- A total of 4.0% of births were twin or higher order in 2004. The rate of **multiple births** has increased by over 33% over the past decade. Nearly 60% of infants of multiple gestation pregnancies have birth weight under 2500 grams.
- Nearly 31% of infants born in 2004 were delivered by **cesarean delivery**, an increase of 6.6% from the 2003 figure of 28.7%.

Fetal and infant deaths

- The **fetal death rate** in 2004 was 7.9 per 1,000 total deliveries. This figure was 5.4 for whites and 13.3 for blacks.
- The **infant mortality rate** was 8.5 per 1,000 live births in 2004, nearly 5% higher than the 2003 rate of 8.1. This represents the second year in a row that the rate has increased. The infant mortality rate was 5.6 for whites, 14.9 for blacks and 5.3 for Hispanics.
- The **neonatal mortality rate** was 6.1 per 1,000 live births in 2004, 5.2% higher than the 2003 rate of 5.8. The rate was 3.9 for whites, 10.8 for blacks and 3.4 for Hispanics.
- The **postneonatal mortality rate** was 2.4 per 1,000 live births in 2004, a 4.3% increase from the rate of 2.3 in 2003. The rate increased from 1.6 to 1.7 among whites but remained constant at 4.1 among blacks.

Deaths

- There were 43,157 **deaths** among Maryland residents in 2004, compared with 44,364 in the year before.
- The **crude death rate** was 776.5 per 100,000 population in 2004, compared with 805.3 in 2003. This represents a 3.6% decrease over the past year.
- Age-specific death rates** declined for all age groups 15 years and above except for the 45-54 group. There were increases in death rates for ages 1-4 and 5-14. There was also an increase in the infant death rate.
- The overall **age-adjusted mortality rate** was 804.6 per 100,000 population in 2004, 5.4% lower than the rate of 850.4 in 2003.
- The **ten leading causes of death**, in rank order, were diseases of the heart, malignant neoplasms, cerebrovascular diseases, chronic lower respiratory diseases, diabetes mellitus, accidents, influenza and pneumonia, septicemia, Alzheimer's disease and nephritis, nephrotic syndrome, and nephrosis.
- The overall age-adjusted death rate for blacks was 1.3 times higher than the rate for whites. Rates were higher among blacks than whites for nine of the ten leading causes of death. The largest **race differential** by cause of death was for HIV disease, with a death rate 12.8 times higher among blacks than whites.
- Heart disease** remained the leading cause of death in 2004. The age-adjusted mortality rate was 211.0 per 100,000 population, 24% lower than the rate a decade ago.
- The second leading cause of death in 2004 was **malignant neoplasms**, responsible for 24% of all deaths. The overall age-adjusted mortality rate for malignant neoplasms was 188.1 per 100,000 population in 2004, 3.2% lower than the rate in 2003.
- Cerebrovascular disease** was the third leading cause of death in 2004 with an age-adjusted mortality rate of 51.3 per 100,000 population.

- **Chronic lower respiratory disease** was the fourth leading cause of death in 2004. The age-adjusted mortality rate was 36.4 per 100,000 population, 5.9% lower than the 2003 rate of 38.7.
- The fifth leading cause of death in 2004 was **diabetes**, with an age-adjusted mortality rate of 26.3 per 100,000 population. Age-adjusted death rates for diabetes have been declining in Maryland but rising nationally.
- **Accidents** were the sixth leading cause of death in 2004 with an age-adjusted mortality rate of 25.5 per 100,000 population, 3.8% lower than the rate in 2003. **Motor vehicle accidents** were responsible for nearly half of all accidental deaths in 2004, while falls accounted for 23% of accidental deaths.
- **Septicemia** was the eighth leading cause of death in 2004. The age-adjusted mortality rate for septicemia was 19.9 per 100,000 population.
- The age-adjusted mortality rate for **Alzheimer's disease** was 17.3 per 100,000 population in 2004. Although the mortality rate for this cause of death has increased by 7% over the last ten years, the rate is showing signs of stabilizing.
- **Human immunodeficiency virus (HIV)** disease was responsible for 551 deaths among Marylanders in 2004. The age-adjusted death rate for HIV has declined by 63% since 1995, when the rate peaked.
- There were 537 **assault (homicide)** deaths among Maryland residents in 2004, compared with 555 in 2003. The age-adjusted homicide rate increased between 2003 and 2004 among whites, but decreased from 27.6 to 24.3 among blacks.
- There were 492 deaths due to **intentional self-harm (suicide)** in 2004. The age-adjusted mortality rate for suicide was 8.7 per 100,000 population, identical to the 2002 and 2003 rates.
- In terms of **place of occurrence**, 94% of all deaths among Maryland residents occurred within the State. Nearly 4% occurred in the District of Columbia and 3% occurred in other states.

Marriages

- There were 38,318 **marriages** in Maryland in 2004. Forty-three percent of marriages were performed in civil (non-religious) ceremonies. Thirty-three percent of brides and 35% of grooms were previously married. Forty-three grooms and 214 brides were under the age of 18.

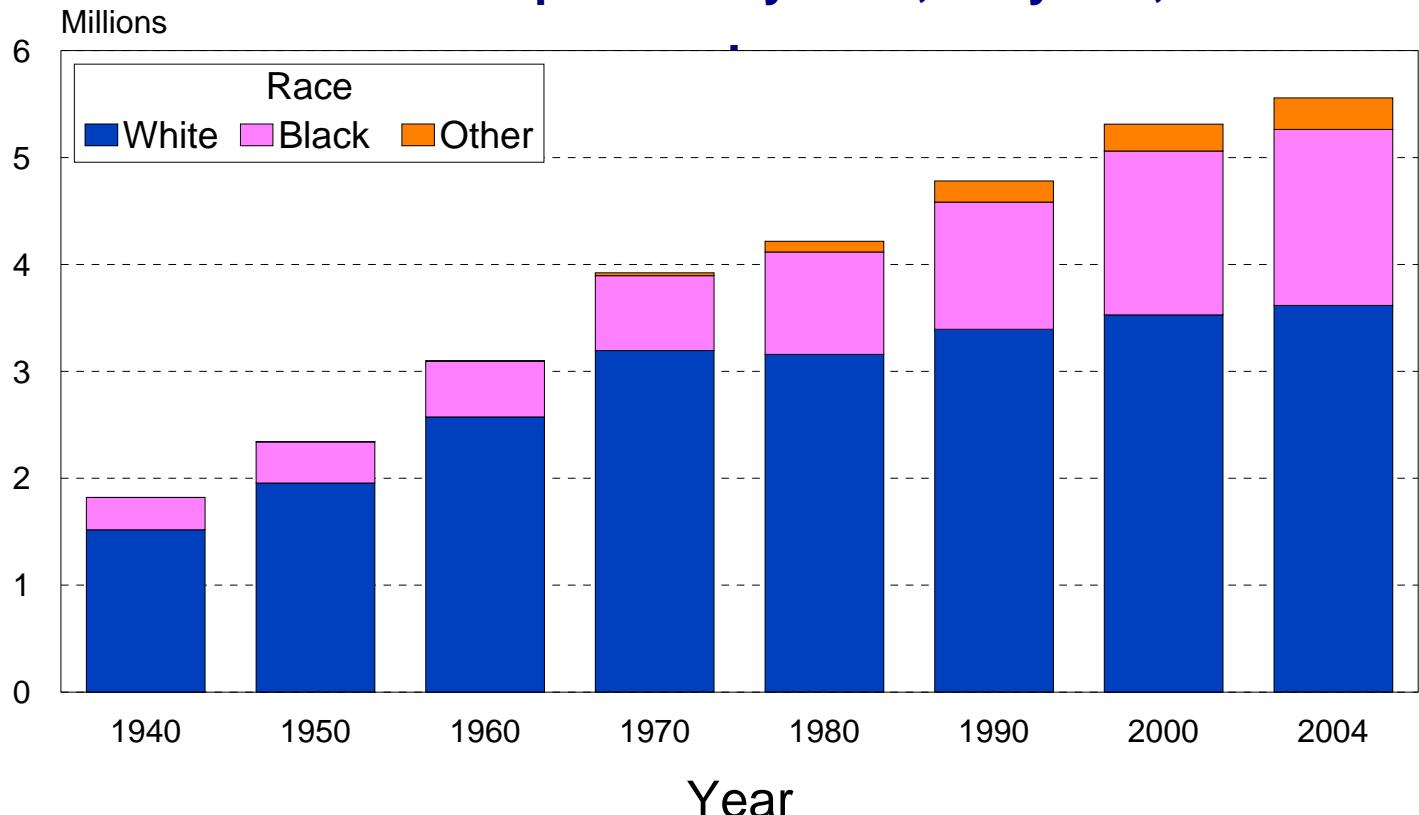

Divorces

- There were 17,802 **divorces and annulments** in 2004. The majority of persons divorcing were between the ages of 30 and 44, and nearly 48% reported having children under the age of 18 years. Over half of divorcing couples had been married less than 10 years, while over 18% had been married 20 or more years.

1 Based on current live birth plus all previous live births.

2 Includes races categorized as 'other'.

3 Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race.

4 Includes all births to mothers of Hispanic origin of any race.

*Race and Hispanic origin are reported separately on the death certificate. Data for persons of Hispanic origin are included in the data for each race group according to the reported race of the decedent.

**Includes all deaths to persons of Hispanic origin of any race.

***Rates are per 1,000 live births by race or Hispanic origin of mother.

****Rates based on fewer than five events in the numerator are not presented since such rates are likely to be unstable.
