DEFINITIONS AND EXPLANATORY NOTES

Data contained in this report are presented on a county of residence basis, regardless of where the vital event occurred, unless specifically noted otherwise. Birth, death and fetal death data include information for all Maryland residents, regardless of whether the birth or death occurred in Maryland, the remainder of the United States, or certain foreign countries that report vital event data to Maryland. Information on marriages and divorces is limited to events occurring in Maryland.

DEFINITIONS

Age-adjustment: A methodology used to compare rates among populations with differing age distributions. The direct method of age-adjustment was used to calculate the rates in this report. Using this methodology, the crude death rate for each age group is multiplied by the proportion of the standard population within that age group; the sum of the products is the age-adjusted rate. Age-adjusted rates in this report are standardized to the projected 2000 U.S. population and are expressed as rates per 100,000 population. Publications prior to 1999 present adjustments to the 1940 standard U.S. population. **Age-adjusted rates should not be compared to crude rates or to adjusted rates calculated using a different standard population.**

Age-specific birth rate: Number of births to mothers of a specific age per 1,000 females in that age group.

Age-specific death rate: Number of deaths in a specific age group per 1,000 or 100,000 population in the same age group.

Crude birth rate: Number of live births per 1,000 population.

Crude death rate: Number of deaths from all causes per 1,000 or per 100,000 population. Death rates for specific causes are per 100,000 population.

General fertility rate: Total number of births per 1,000 females aged 15-44.

Fetal death*: The death of a product of human conception, before its complete expulsion or extraction from the mother, regardless of the duration of the pregnancy, as indicated by the fact that, after the expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as heart beat, pulsation of the umbilical cord, or definite movement of voluntary muscle.

Fetal mortality rate*: Number of reportable* fetal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty or more weeks' gestation.

Infant death: Death occurring to a person under one year of age.

Infant mortality rate: Number of infant deaths per 1,000 live births.

Length of pregnancy: A measure of the duration of gestation in completed weeks as estimated by the attending physician.

Live birth*: The complete expulsion or extraction of a product of human conception from the mother, regardless of the period of gestation, if, after the expulsion or extraction, it breathes or shows any other evidence of life, such as heart beat, pulsation of the umbilical cord, or definite movement of voluntary muscle, whether or not the umbilical cord is cut or the placenta is attached.

Life expectancy: The average number of years of life remaining for an individual of a particular age group.

Low birth weight: A live birth weighing less than 2,500 grams (5.5 pounds).

Neonatal death: Death occurring to an infant under 28 days of age.

Neonatal mortality rate: Number of neonatal deaths per 1,000 live births.

Perinatal death: In this report, defined as the death of a fetus of 28 or more weeks' gestation or of an infant less than 7 days of age.

Perinatal death rate: In this report, defined as the number of perinatal deaths divided by the number of fetal deaths of 28 or more weeks' gestation plus the number of live births times 1,000. See perinatal death.

Postneonatal death: Death occurring to an infant between 28 days and one year of age.

Postneonatal mortality rate: Number of postneonatal deaths per 1,000 live births.

*The definitions of live birth and fetal death are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition – Supplement. Fetal deaths are reportable for filing purposes only if the death occurs after a period of gestation of twenty or more completed weeks (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report are only those of twenty or more weeks gestation.

EXPLANATORY NOTES

Population

The U.S. Census Bureau's Population Estimates Program produces annual estimates by race, sex, age, and Hispanic ethnicity for national, state and county populations. The population estimates in this report for Maryland are from the Vintage 2022 estimates (released June 2023), which include population estimates for July 1, 2020, through July 1, 2022. These estimates were derived from data on births, deaths, net migration (domestic and international), and a population base incorporating the 2020 Census, Vintage 2020 estimates, and 2020 Demographic Analysis estimates. Estimates by race, Hispanic origin, sex, and age group are prepared for all states and counties. Single year age estimates at the county level were provided by the U.S. Census Bureau Population Division through a data request. Further information on the preparation of population estimates may be found on the U.S. Census Bureau website at <http://www.census.gov/popest/>.

Note: Due to changes in population estimation methodology and input data available at the U.S. Census Bureau, rates after 2020 are not directly comparable to rates from before 2020. The 5-year trend analyses will resume with the 2023 annual report after the release of the intercensal estimates by the Census Bureau in Fall 2024.

Population estimates in the Maryland Vital Statistics Annual Reports prior to 2021 were based on “bridged-race” estimates prepared by the National Center for Health Statistics (NCHS) in collaboration with the U.S. Census Bureau. “Bridging” the 31 racial categories used since Census 2000 to the four single race categories specified in the 1977 U.S. Office of Management and Budget (OMB) standards (Asian or Pacific Islander, Black or African American, American Indian or Alaska Native, White) was done to make race information in State birth and death records compatible with Census population estimates. Beginning in 2021, NCHS no longer provided “bridged-race” estimates to states. Rather NCHS now reports single-race categories according to the standards on race and ethnicity set by the OMB in 1997. A notable change to single-race categories – that is, categories for which only one race is reported – included the addition of a “Two or more races” or multi-race category in which two or more races are aggregated. Maryland VSA adopted these new standards beginning with the 2021 Annual Report and for reports going forward.

Cause of Death

The tenth revision of the International Classification of Diseases (ICD-10) has been used to code the causes of death reported on death certificates since 1999. The ICD is a classification system for mortality data developed by the World Health Organization and other international centers to promote comparability in the collection, classification, processing, and presentation of mortality statistics. The ICD-10 is

periodically revised to reflect advances in medical science. ICD-10 replaced ICD-9, which was used with 1979-98 data.

ICD-10 differs substantially from ICD-9. ICD-10 includes expanded detail for many conditions, transfers conditions between classifications, incorporates the use of alphanumeric instead of numeric codes, modifies coding rules and modifies tabulation lists. Because of these changes, the presentation of mortality data by cause of death is substantially different, and discontinuities in trend data between ICD revisions are likely to exist for certain causes of death. Additional information on the history of the classification of diseases and the causes of death may be found at http://www.cdc.gov/nchs/data/misc/classification_diseases2011.pdf

Age-adjusted Death Rates

As described in page ix of this report, age-adjustment is the process used to compare rates among populations with differing age distributions. Age-adjustment is used to eliminate the confounding effect of differences in age distributions among groups or over time.

Beginning with data year 1999, all federal agencies adopted the year 2000 projected U.S. population as the standard for age-adjusting death rates. The year 2000 population replaced at least three different population standards used in earlier years. The use of these multiple standards resulted in difficulties comparing data prepared by agencies using different standards, and caused confusion among data users. Use of the 2000 standard was recommended to promote uniformity of data among agencies and to eliminate the need to calculate mortality rates using more than one standard. All age-adjusted rates presented in the Maryland Vital Statistics Annual Report have been calculated using the year 2000 standard population. Age-adjusted rates prepared using the year 2000 standard cannot be compared with rates calculated using other standards.

Race and Hispanic Origin

Several charts and tables in this report show data categorized by race and Hispanic origin. It is important to note that Hispanic origin is an ethnicity classification and can occur concurrently with any race. All birth data in the report are based on the race and Hispanic origin of the mother. In cases of death data, the race and Hispanic origin of the decedent is used. Thus, data for individuals of Hispanic origin are displayed across race categories excluding those specified as “Non-Hispanic.” Alternatively, categories labeled “Hispanic” are inclusive of all persons of Hispanic origin regardless of reported race. Therefore, an overlap exists between categories labeled “Hispanic” and those which include data on Hispanic individuals organized by race.
