INTRODUCTION

This report highlights 2006 data collected in Maryland through the Pregnancy Risk Assessment Monitoring System (PRAMS). PRAMS is a surveillance system established by the Centers for Disease Control and Prevention (CDC) in 1987 to obtain information about maternal behaviors and experiences that may be associated with adverse pregnancy outcomes. Data are collected by surveying women who have recently delivered live born infants.

PRAMS projects are conducted through cooperative agreements between the CDC and state health departments. PRAMS projects are currently underway in 37 states, New York City and South Dakota (Yankton Sioux Tribe). All surveys include a core set of standardized questions, which allows for multi-state analyses. In addition, each state can add questions tailored to meet its needs. The core section of the survey includes questions relating to prenatal care, obstetric history, smoking, alcohol use, physical abuse, contraception, economic status, maternal stress, and infant health. The Maryland-specific section of the survey includes questions on assisted reproduction, contraceptive use, depression, oral health, chronic disease, physical activity, and infections.

The PRAMS project in Maryland is a collaborative effort of the Center for Maternal and Child Health (CMCH), the Vital Statistics Administration (VSA) of the Maryland Department of Health and Mental Hygiene, and the CDC. Maryland began collecting PRAMS data from mothers who delivered in 2000.

METHODOLOGY

Sampling and Data Collection

Women eligible to participate in PRAMS are selected from Maryland's live birth certificate files. Each month, a stratified, random sample of approximately 200 live births is selected. The sample is stratified by maternal age (<35 years, ≥35 years) and infant birth weight (<2500 grams, ≥2500 grams). This sampling frame over-samples mothers who have delivered a low birth weight infant (<2500 grams) as well as mothers who are 35 years of age or older.

PRAMS combines two modes of data collection including a survey conducted by mailed questionnaire with multiple follow-up attempts, and if mail is not successful, a survey conducted by telephone interview. Survey questionnaires and other materials are available in both English and Spanish.

The first mailing, which is done two to four months after delivery, is a letter that introduces PRAMS to the mother and informs her that a questionnaire will soon arrive. Within seven days of this letter, the questionnaire packet is mailed. This packet includes the 76-item survey, informed consent page, PRAMS brochure, calendar and resource brochure. In addition, a telephone card is sent as an incentive for completing the survey. Seven to 10 days after the initial packet is mailed, a tickler that serves as a thank you and reminder note is sent. Mothers who do not respond to the tickler within seven to 14 days are mailed a second questionnaire

packet. A third questionnaire packet is mailed to all remaining nonrespondents seven to 14 days later. Telephone follow-up is initiated for all nonrespondents.

Data collected through PRAMS are linked to birth certificate data, which allows for the survey data to be weighted to reflect the total birth population. Sampling, nonresponse and noncoverage adjustment factors are applied to the data in order to make the results generalizable to the state's population of women delivering live born infants during the study period. Further information on PRAMS methodology, including weighting procedures, may be found on the CDC website at <http://www.cdc.gov/reproductivehealth/methodology.htm>.

Survey Response and Data Analysis

CDC recommends that states obtain a response rate of at least 70% for analysis of PRAMS. The weighted response rate among women delivering in Maryland between January 1, 2006 and December 31, 2006 was 71%. During this period, 1,712 mothers completed the PRAMS questionnaire with a weighted response reflecting 69,014 mothers. The weighted figure included 33,415 births to white non-Hispanic women and 21,990 births to black non-Hispanic women. Survey findings in this report are shown by race/Hispanic origin (White Non-Hispanic, Black Non-Hispanic, Asian and Hispanic), maternal age and maternal years of education.

All data in this report were prepared using weighted PRAMS data and SUDAAN software. Percentages shown for each survey item are based on the number of mothers who responded to that item, with missing observations excluded. With the exception of questions relating to barriers to obtaining prenatal care (Question 22), HIV testing during pregnancy (Question 25), smoking (Questions 31-33), alcohol use (Questions 35-36), duration of breastfeeding (Question 54) and barriers to using postpartum birth control (Question 61), the percentage of missing observations was less than 5% for each of the survey items presented in this report. Percentages for subcategories of survey items based on fewer than five respondents are not reported since estimates based on small numbers may be unreliable.

ACKNOWLEDGMENTS

The Maryland PRAMS Project would like to acknowledge the CDC PRAMS Team for their technical assistance and support, especially Denise D'Angelo, M.P.H. our project manager who has expertly guided and assisted our program. Additionally, our thanks go to the Maryland PRAMS Steering Committee for their invaluable input to many aspects of our project.

Most importantly, we very much appreciate all the 1,712 mothers who took the time to complete the questionnaires that are represented in this report. Their answers will contribute greatly towards our continuing efforts to improve the health of Maryland mothers and babies.

Maryland PRAMS Highlights--2006

Preconception factors

- Forty percent of all pregnancies were **unintended**.
- Twelve percent of mothers reported a **pregnancy loss** in the twelve months preceding the current pregnancy.
- Sixty-seven percent of women reported having **health insurance** just before pregnancy, and 7% reported they were covered by **Medicaid or Health Choice**.
- Thirty-two percent of women reported taking a **multivitamin daily** in the month before conception.
- Twelve percent of mothers who were attempting to become pregnant used **fertility treatments**; 34% reported using fertility drugs, 16% used artificial insemination, and 23% used assisted reproductive technology.

Prenatal factors

- Seventy-four percent of mothers began **prenatal care** during the first trimester of pregnancy, and 1% received no care.
- Sixty-seven percent of women reported that **health insurance or an HMO** paid for their prenatal care; 28% reported that **Medicaid or Health Choice** paid for their care.
- Thirty-seven percent of women participated in the **WIC** program during pregnancy.
- Fifty-three percent of mothers reported one or more **medical complications** during pregnancy; severe nausea, preterm labor, and kidney or bladder infections were the most common complications.
- Eighty-one percent of mothers reported that **HIV testing** was discussed during prenatal care visits; 80% reported getting an HIV test.
- Eight percent of women **smoked** during the last

three months of pregnancy, and 7% reported using **alcohol**. Fewer than 1% of women reported a binge-drinking episode during the last three months of pregnancy.

- Four percent of mothers reported being **physically abused** by an ex-husband or ex-partner during pregnancy, and 3% reported being abused by a husband or partner.
- Forty-five percent of mothers had a routine **dental visit** during pregnancy, and 28% needed to be seen for a dental problem.

Infant health and related factors

- Eleven percent of newborns were admitted to a **neonatal intensive care** unit.
- Fifty-five percent of newborns were **discharged from the hospital** within two days of delivery, and 7% remained in the hospital for 6 or more days.
- Eighty-one percent of infants were **breastfed** after delivery, and 70% were breastfed four weeks or longer.
- In terms of **sleeping position**, 69% of infants were usually placed on their backs to sleep, and 12% on their stomachs.
- Ninety-nine percent of infants had a **well-baby checkup**.

Maternal postpartum factors

- Fifteen percent of mothers reported they were not using **postpartum contraception**.
- Twelve percent of mothers **smoked postpartum**.
- Thirty-four percent of mothers reported that they had not discussed **postpartum depression** with their health care providers during prenatal or postpartum visits.
